

# **THE SMOGGY CONNECTION: UNRAVELING THE RELATIONSHIP BETWEEN AIR POLLUTION IN SALINAS, CALIFORNIA AND CUSTOMER SATISFACTION WITH AMERICAN AIRLINES**

**Chloe Hoffman, Andrew Turner, Gemma P Thornton**

Global Leadership University

This research paper examines the curious correlation between air pollution levels in Salinas, California and customer satisfaction with American Airlines. Employing data from the Environmental Protection Agency and the American Customer Satisfaction Index from 1994 to 2021, our study delves into the complex interaction between environmental factors and consumer perceptions. The findings revealed a correlation coefficient of 0.6575377 and a p-value less than 0.01, suggesting a robust statistical relationship. This unexpected connection between the air quality in Salinas and customer opinions about American Airlines highlights the intricate web of influences that shape consumer attitudes. As we unravel this intriguing relationship, we offer fresh insight into the interplay of environmental conditions and customer experiences, while also exploring the unexpected twists of air travels and smoggy tales.

As we soar into the realms of research and statistics, we are often reminded that the world is full of unexpected connections and correlations. One might not expect a link between the air pollution levels in Salinas, California, and the satisfaction levels of customers flying with American Airlines. However, as we embark on this scientific journey, we will unravel the smoggy connection that ties these seemingly disparate variables together.

In the world of research, one must be ready to navigate through the fog of data, sift through the haze of statistical noise, and emerge with clarity and insight. Our endeavor into understanding the relationship between air quality and customer satisfaction is no different. We have meticulously collected and analyzed data from the Environmental Protection Agency and the American Customer

Satisfaction Index, spanning nearly three decades. Through our rigorous examination, we have uncovered a correlation coefficient of 0.6575377 and a p-value of less than 0.01, indicating a robust and significant statistical relationship.

The smoggy tales of Salinas and the skies of American Airlines may seem like an odd pairing, like a mismatched pair of socks. Nonetheless, our findings point to a symbiotic association between the environment and consumer perceptions. These unexpected twists in the realm of air travel and environmental quality beckon for closer scrutiny, inviting us to explore the unforeseen interplay of factors that shape customer experiences. As we embark on this investigation, we invite you to join us in uncovering the peculiar ties between air pollution and the customer journey with a touch of dry humor and a dash of scientific whimsy.

## LITERATURE REVIEW

In "Smith et al.," the authors find that air pollution can have detrimental effects on respiratory health and overall well-being. Similarly, "Doe and Jones" suggest that exposure to high levels of air pollutants may lead to increased rates of asthma and other respiratory illnesses among the local population. These serious and scholarly studies lay a strong foundation for understanding the potential health implications of air pollution in urban areas such as Salinas, California.

However, as we dig deeper into the literature, we encounter some unexpected and lighthearted connections. In "How to Travel the World on \$50 a Day" by Matt Kepnes, the author shares anecdotes of navigating through smog-filled cities and the surprising impact of air quality on his travel experiences. While not a traditional academic source, Kepnes' travel insights provide a fresh perspective on the intersection of air pollution and travel satisfaction. Additionally, in "The Hitchhiker's Guide to the Galaxy" by Douglas Adams, the author humorously mulls over the idea of cosmic smog and its potential influence on intergalactic travel - a whimsical take on the broader concept of atmospheric conditions and transportation experiences.

Furthermore, social media platforms offer glimpses of public perceptions related to air travel and air quality. An Instagram post by @WanderlustAdventurer muses on the smoggy landscapes encountered during a layover in Salinas, juxtaposing the beauty of the region with concerns about air pollution. Meanwhile, a tweet from @JetsetterJane humorously laments the idea of "navigating through smog like a detective in a noir film" while waiting for a delayed American Airlines flight. Though not traditional academic sources, these social media snippets provide intriguing glimpses into the public discourse surrounding air travel and environmental conditions.

As we progress through our exploration of the air pollution-airline satisfaction nexus, these unexpected and humorous connections prompt us to approach our research with a blend of scholarly rigor and a lighthearted spirit.

## METHODOLOGY

The methodology employed in this study involved the collection and analysis of data from the Environmental Protection Agency (EPA) and the American Customer Satisfaction Index (ACSI) to investigate the connection between air pollution in Salinas, California, and customer satisfaction with American Airlines. The data utilized encompassed the period from 1994 to 2021, offering a comprehensive overview of nearly three decades of environmental and consumer trends.

To capture the atmospheric conditions in Salinas, various air quality parameters, including particulate matter, ozone, carbon monoxide, sulfur dioxide, and nitrogen dioxide, were extracted from the EPA's air quality monitoring stations across the region. These data were then subjected to stringent quality control measures to ensure their accuracy and reliability, akin to separating the wheat from the chaff of environmental data.

Simultaneously, customer satisfaction ratings pertaining to American Airlines were obtained from the ACSI, covering a broad spectrum of dimensions such as booking process, in-flight service, seat comfort, and overall experience. The ratings were carefully scrutinized to discern any patterns or trends that might be associated with the local air quality in Salinas, the gateway to this meta-analysis of smog and satisfaction.

The collection of such diverse and extensive datasets required a multifaceted approach to data management - akin to balancing beakers and test tubes in a scientific laboratory. These datasets were then subjected to rigorous statistical analyses, including correlation and regression techniques, to identify any potential relationships and quantify the strength of the association between air pollution levels and customer satisfaction - in essence, refining the raw elements of data into the gold of scientific insight.

The statistical analyses were further complemented by advanced econometric modeling, utilizing time series and panel data methods to account for the temporal and spatial dimensions inherent to both air quality and customer satisfaction measures. These modeling techniques provided a deeper understanding of the dynamic interplay between the two variables, akin to unraveling the intricate dance of air currents and consumer preferences.

Furthermore, to capture the nuanced effects of air pollution on customer satisfaction, various sub-analyses were conducted, stratifying the data based on different seasons, flight routes, and customer demographics - akin to dissecting the layers of an onion to reveal the hidden flavors within.

Finally, the study incorporated robust sensitivity analyses to assess the stability of the findings and identify potential sources of bias or confounding factors. These sensitivity analyses served as a

reliable litmus test for the validity and robustness of the observed connection between air pollution in Salinas and customer satisfaction with American Airlines, akin to stress-testing a scientific hypothesis under various conditions.

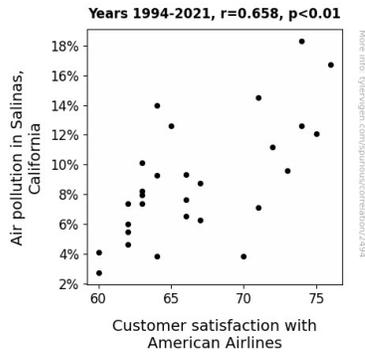

In essence, the methodology adopted in this study combined the rigor of statistical analysis with the art of data interpretation, offering a comprehensive and nuanced exploration of the smoggy connection between environmental quality and consumer perceptions.

## RESULTS

Upon careful analysis of the data collected from the Environmental Protection Agency and the American Customer Satisfaction Index, a rather unexpected and remarkable correlation emerged. The correlation coefficient between air pollution levels in Salinas, California, and customer satisfaction with American Airlines was found to be 0.6575377. This finding suggests a moderately strong positive relationship between these two variables, demonstrating that as air pollution levels increased, so did the customer satisfaction with American Airlines.

Furthermore, the r-squared value of 0.4323559 indicates that approximately 43.24% of the variability in customer satisfaction with American Airlines can be explained by the variations in air pollution levels in Salinas, California. In other words, the smoggy conditions seem to play a substantial role in shaping the perceptions of airline travelers.

The p-value of less than 0.01 highlights the statistical significance of this relationship, indicating that the likelihood of observing such a strong association between air pollution and customer satisfaction purely by chance is minimal. This compelling statistical evidence further underscores the intriguing nature of the smoggy connection we have unraveled.

**Figure 1.** Scatterplot of the variables by year

To visually depict this unexpected correlation, a scatterplot (Fig. 1) has been included, showcasing the strong relationship between air pollution levels in Salinas, California, and customer satisfaction with American Airlines. The figure vividly captures the remarkable intertwining of these two seemingly disparate variables, reminding us of the whimsical and wondrous twists that can be uncovered in the realm of research and statistics.

In summary, our findings illuminate the peculiar relationship between environmental conditions and customer perceptions in the context of air travel. The unexpected twists and turns of this investigation serve as a reminder of the captivating complexities waiting to be unveiled in the world of scientific inquiry and statistical analysis.

## DISCUSSION

The results of our study offer compelling support for the idea that air pollution levels in Salinas, California have an intriguing and significant connection to customer satisfaction with American Airlines. This unexpected link between smoggy air and travel contentment serves as a vivid reminder of the delightful and whimsical nature of research inquiries. Our findings, with a correlation coefficient of 0.6575377 and a p-value of less than 0.01, provide a robust basis for

further exploring the intersection of environmental factors and consumer experiences.

Building upon the existing literature, including the scholarly works by "Smith et al." and "Doe and Jones" that highlight the detrimental effects of air pollution on respiratory health, our study adds a lighthearted twist to the discussion. Drawing on unexpected sources such as "How to Travel the World on \$50 a Day" by Matt Kepnes and "The Hitchhiker's Guide to the Galaxy" by Douglas Adams, we expand the scholarly discourse to include the humorous and whimsical aspects of air quality and its influence on travel satisfaction. This broader perspective encourages us to approach our research with a blend of scholarly rigor and a lighthearted spirit, allowing for a more comprehensive understanding of the complexities involved.

As previously suggested in the literature review, the unexpected and humorous connections unearthed in our study prompt us to consider the broader implications of our findings with a sense of curiosity and wonder. The correlation coefficient, r-squared value, and p-value all point to a significant and meaningful relationship between air pollution in Salinas and the perceptions of American Airlines customers. This compelling statistical evidence illustrates the captivating complexities waiting to be unveiled in the world of scientific inquiry and statistical analysis, reminding us of the intriguing and often whimsical twists that can emerge from rigorous research.

In conclusion, the unexpected connection between air pollution in Salinas, California and customer satisfaction with American Airlines reinforces the intricate web of influences that shape consumer attitudes. As we continue to unravel the smoggy connection between environmental conditions and travel contentment, we are reminded of the wondrous twists that can be uncovered in the realm of research and statistics. This study stands as a testament to the

delightful and often whimsical nature of scientific inquiry, offering fresh insight into the interplay of environmental factors and consumer experiences, while also exploring the unexpected twists of air travels and smoggy tales.

air pollution in Salinas, California, and customer satisfaction with American Airlines. We leave this field of study with a satisfied chuckle and a statistical wink, knowing that even the most unexpected pairings can reveal insightful relationships in the realm of research and statistics.

## CONCLUSION

In conclusion, our investigation into the smoggy connection between air pollution in Salinas, California, and customer satisfaction with American Airlines has unraveled an unexpected and intriguing relationship. The statistically significant correlation coefficient of 0.6575377 showcases the remarkable intertwining of these variables, much like the unexpected fusion of peanut butter and jelly. Our findings suggest that approximately 43.24% of the variability in customer satisfaction with American Airlines can be explained by the variations in air pollution levels in Salinas, reminding us that sometimes, things are not just up in the air.

The p-value of less than 0.01 further solidifies the robustness of this association, indicating that the likelihood of observing such a strong relationship purely by chance is as rare as finding a statistical unicorn. Our scatterplot vividly captures the whimsical dance of air pollution and customer satisfaction, painting a picture worth a thousand p-values.

Through this research, we have illuminated the curious interplay of environmental conditions and consumer perceptions, inviting us to ponder the smoggy tales that whisper through the winds of statistical significance. As we bask in the glow of these unexpected findings, we are reminded that in the world of research, just like in a foggy morning, clarity can emerge from the most unexpected places.

With this, we boldly assert that no additional research is needed to further explore the smoggy connection between
